Errata to the paperback edition of

Probability on Trees and Networks

by Russell Lyons and Yuval Peres

Cambridge University Press, 2021

Errata date: 19 August 2026

p. (i): "connections on" should be "connections of".

p. 84: Both instances of "iff" in Example 3.7 should be "if".

p. 119: In Exercise 4.15, $\tau_{x_{k+1},\dots,x_n}$ should be $\tau_{\{x_{k+1},\dots,x_n\}}$.

p. 179: In the proof of Theorem 6.2, "a, b, c, d" would be better as "b and d".

p. 183: In the proof of Theorem 6.5, "some vertex x on the cycle, and hence $\mathsf{flow}_+(\theta, x) \geq n + 2 > 1$." should be "some vertex on the cycle."

p. 268: In the paragraph after the proof of Theorem 7.18, replace from "every transitive graph" to the end of the paragraph by "Let G be a transitive graph of polynomial growth. There is an equivalence relation on its vertices that has the following properties: It is preserved by $\mathrm{Aut}(G)$ and its classes have finite cardinality at least 2; if we define G' to be the transitive graph on the equivalence classes where two classes are adjacent iff G has some edge that joins a vertex in one class to a vertex in the other and let n be the size of the stabilizer of a vertex in G', then n is finite and the graph nG' is a Cayley graph, where nG' has vertex set $\mathsf{V}(G') \times \{1, \dots, n\}$ and edges connecting pairs (x, j) to (y, k) when $[x, y] \in \mathsf{E}(G')$."

p. 302: In order to apply Selberg's lemma, we need to know that Γ' is finitely generated. Indeed, whenever Γ is a discrete, quasi-transitive group of automorphisms of a graph, G, then Γ is finitely generated. To see this, let G' be a transitive representation of G corresponding to a vertex, o. Then Γ acts transitively on G', and so is generated by its elements that take o to a neighbor of o in G' or that fix o. Since the stabilizer of o is finite, so is this generating set.

pp. 303–304: In the paragraph spanning these two pages, change the three occurrences of "density" to "intensity". In the line following (8.27), change $\mathbf{P}\big[\,|\Xi \cap A| \geq 2\big]$ to $\mathbf{E}\big[\,|\Xi \cap A|\,;\ |\Xi \cap A| \geq 2\big]$.

p. 392: In the proof of Proposition 11.2, replace "Prim's" by "Kruskal's".

p. 467: In Exercise 13.26, change -3 to -2 and $(5 + \sqrt{7})/6 = 1.27^+$ to $4/3$.

p. 489: Remark 14.32 does not always give a compact boundary, as pointed out by Ali Khezeli, who also suggested a solution. Replace the sentences beginning with the third by the following. "Extend the metric ρ from $\{0, 1\}^{\mathbb{N}}$ to $[0, 3]^{\mathbb{N}}$ by the same formula. Enumerate V as $\langle v_n \rangle_{n \in \mathbb{N}}$. Let $\phi\colon \mathsf{V} \to [0, 3]^{\mathbb{N}}$ be the injection $\phi(x) := \langle u_n(x) + 2 \cdot \mathbf{1}_{\{v_n\}}(x) \rangle_{n \in \mathbb{N}}$. Write V' for the image of ϕ. If $\Theta' := \partial \mathsf{V}' \subseteq [0, 1]^{\mathbb{N}}$ is the set of limit points of V', then $\mathsf{V}' \cup \Theta'$ is compact. Furthermore, V' is discrete in $\mathsf{V}' \cup \Theta'$ because $\phi(v_n)_n - \eta_n \geq 1$ for $\phi(v_n) \neq \eta \in \mathsf{V}' \cup \Theta$, so $\rho\big(\phi(v_n), \eta\big) \geq 2^{-n}$. Define $\mathbf{b}'$ as in Definition 14.26 (so $\mathbf{b}'(\mathbf{x}) := \lim_k \phi(x_k)$ where this

converges). Let $\mathbf{b}$ be as in the preceding proof. Since $\lim_k u_n(x_k) = I_n(\mathbf{x})$ for $\mathbf{P}_o$-a.e. $\mathbf{x} \in \mathsf{V}^{\mathbb{N}}$ and every n, it follows that $\mathbf{b}' = \mathbf{b}$ $\mathbf{P}_o$-a.s. Therefore, $\nu_o(\Theta' \cap \Theta) = 1$. After identifying V with V', we find that all the conditions of Definition 14.26 are satisfied, so $(\Theta', \mathscr{B}_{\Theta'}, \mathbf{b}')$ is a compactification boundary of (V, P)."

pp. 510 and 677: "Orstein" should be "Ornstein".

p. 604: The solution to 2.122(g) should be "Write $f = h + \psi$ and $g = \widehat{h} - \psi$."

p. 610: The last paragraph of the comments on Exercise 4.48 should read as follows: "The actual rate of decay of the probabilities for the uniform spanning tree is likely $\mathbf{P}[L \geq n] \asymp 1/n^{3/5}$. This was predicted by Manna, Dhar, and Majumdar (1992), even in the sharper form $\mathbf{P}[L = 2n + 1] \asymp 1/n^{8/5}$."

p. 616: In Exercise 6.34, v should be x both times that v appears. At the end, "for some x" should be "for some $x \in \partial_{\mathsf{V}} K$".

p. 650: The citation "(2015b) Minimal harmonic functions I, upper bounds. In preparation." should be "(2017) Minimal growth harmonic functions on lamplighter groups. *New York J. Math.*, **23**, 833–858. `MR: 3690233`". Consequently, the citations to (2015a) should be to (2015) and to (2015b) should be to (2017); these occur on pp. 509 and 510.
