BEING QUASI-AFFINE IS FPQC LOCAL ON THE BASE

THE STACKS PROJECT AUTHORS

Editorial note. All delivered mathematical text is the author's own, copied verbatim from the pinned Stacks Project chapter file spaces-descent.tex; no statement or proof step was rewritten, reordered or removed.

Editorial note. The author's parenthetical '(verification omitted, compare with Descent, Lemma descent-lemma-descent-data-sheaves)' inside the descent-datum step is kept verbatim: it omits only the routine cocycle check of \varphi, with the schemes-side comparison given, while the main line is fully derived.

Editorial note. The counted span cites lemmas in Descent, Morphisms of Spaces and Properties of Spaces plus same-chapter lemmas, recorded in assembly.external_references with canonical tags as navigation pointers.

Allowed standard prerequisites (editorial).

- Framework lemma for descending properties of morphisms. Stacks Project, Descent on Spaces, Lemma lemma-descending-properties-morphisms. Supplies the criterion structure that the proof verifies.
- Quasi-affineness is local in the \'etale topology. Stacks Project, Morphisms of Spaces, Lemma spaces-morphisms-lemma-quasi-affine-local. Supplies assumptions (1) and (2).
- Effectivity of quasi-affine descent data. Stacks Project, Descent, Lemma descent-lemma-quasi-affine (with Definition descent-definition-descent-datum). Supplies the quasi-affine scheme Y \to Z from the descent datum.
- Algebraic spaces satisfy the fpqc sheaf condition. Stacks Project, Properties of Spaces, Proposition spaces-properties-proposition-sheaf-fpqc. Supplies the morphism Y \to X from the descent datum element.
- fpqc descent of the isomorphism property. Stacks Project, Descent on Spaces, Lemma lemma-descending-property-isomorphism. Supplies that Y \to X is an isomorphism from its base change being one.

Lemma 0.1. *The property $\mathcal{P}(f) =$"f is quasi-affine" is fpqc local on the base.*

Proof. We will use Lemma 041J to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 03WM. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is quasi-affine. Let X' be a scheme representing $Z' \times_Z X$. We obtain a canonical isomorphism

$$\varphi : X' \times_Z Z' \longrightarrow Z' \times_Z X'$$

since both schemes represent the algebraic space $Z' \times_Z Z' \times_Z X$. This is a descent datum for $X'/Z'/Z$, see Descent, Definition 023V (verification omitted, compare with Descent, Lemma 02W5). Since $X' \to Z'$ is quasi-affine this descent datum is effective, see Descent, Lemma 0247. Thus there exists a scheme $Y \to Z$ over Z and an isomorphism $\psi : Z' \times_Z Y \to X'$ compatible with descent data. Of course $Y \to Z$ is quasi-affine (by construction or by Descent, Lemma 02L7). Note that $\mathcal{Y} = \{Z' \times_Z Y \to Y\}$ is a fpqc covering, and interpreting ψ as an element of $X(Z' \times_Z Y)$ we see that $\psi \in \check{H}^0(\mathcal{Y}, X)$. By the sheaf condition for X (see Properties of Spaces, Proposition 0APL) we obtain a morphism $Y \to X$. By construction the base change of this to Z' is an isomorphism, hence an isomorphism by Lemma 041Y. This proves that X is representable by a quasi-affine scheme and we win. □
