

Diagrammatic equation showing the equivalence of two particle interaction processes:

Left side (Input process):

- Two incoming lines labeled i_1 and i_2 (grey) meet at a vertex.
- Two outgoing lines labeled k_1 (red) and k_2 (blue) emerge from the vertex.
- These lines then enter a second vertex.
- Two incoming lines labeled l_1 (red) and l_2 (blue) meet at this second vertex.
- Two outgoing lines labeled j_1 and j_2 (grey) emerge from the second vertex.

Right side (Output process):

- A single four-point vertex where two incoming lines i_1 and i_2 cross.
- Two outgoing lines j_1 and j_2 cross.
- The crossing lines are colored: the line from i_2 to j_1 is red, and the line from i_1 to j_2 is blue.

The two diagrams are connected by an equals sign ($=$), indicating they represent the same physical process.
