INCLUSION OF THE SMALL ETALE SITE IN THE BIG SITE AS SUBCANONICAL SUBTOPOLOGIES

THE STACKS PROJECT AUTHORS

Editorial note. All delivered mathematical text is the author's own, copied verbatim from the pinned Stacks Project chapter file topologies.tex; no statement or proof step was rewritten, reordered or removed.

Editorial note. Span recomputation by label pairing (LANE_BRIEF 10.2): the official pool candidate recorded statement [4220, 4224] and proof(s) [[4226, 4232]]; this spec covers the complete environment instead (statement 4220-4224, proof span(s) [(4226, 4232)]), since in this chapter the author's proof environment(s) follow the statement environment and some pool entries under-counted them.

Source reference. Original reference 000J: sources/stacks-chow/tags.txt, source lines 28–28. Cross-chapter standard prerequisite cited by the author inside the counted span; it is used as a pointer and its own proof is not part of this item.

Source reference. Original reference 000X: sources/stacks-chow/tags.txt, source lines 42–42. Cross-chapter standard prerequisite cited by the author inside the counted span; it is used as a pointer and its own proof is not part of this item.

Lemma 0.1. *Any set of big Zariski sites is contained in a common big Zariski site. The same is true, mutatis mutandis, for big fppf and big étale sites.*

Proof. This is true because the union of a set of sets is a set, and the constructions in Sets, Lemmas 000J and 000X allow one to start with any initially given set of schemes and coverings. □
